Background

1. Heng et al. *Lancet Oncol.* 2013

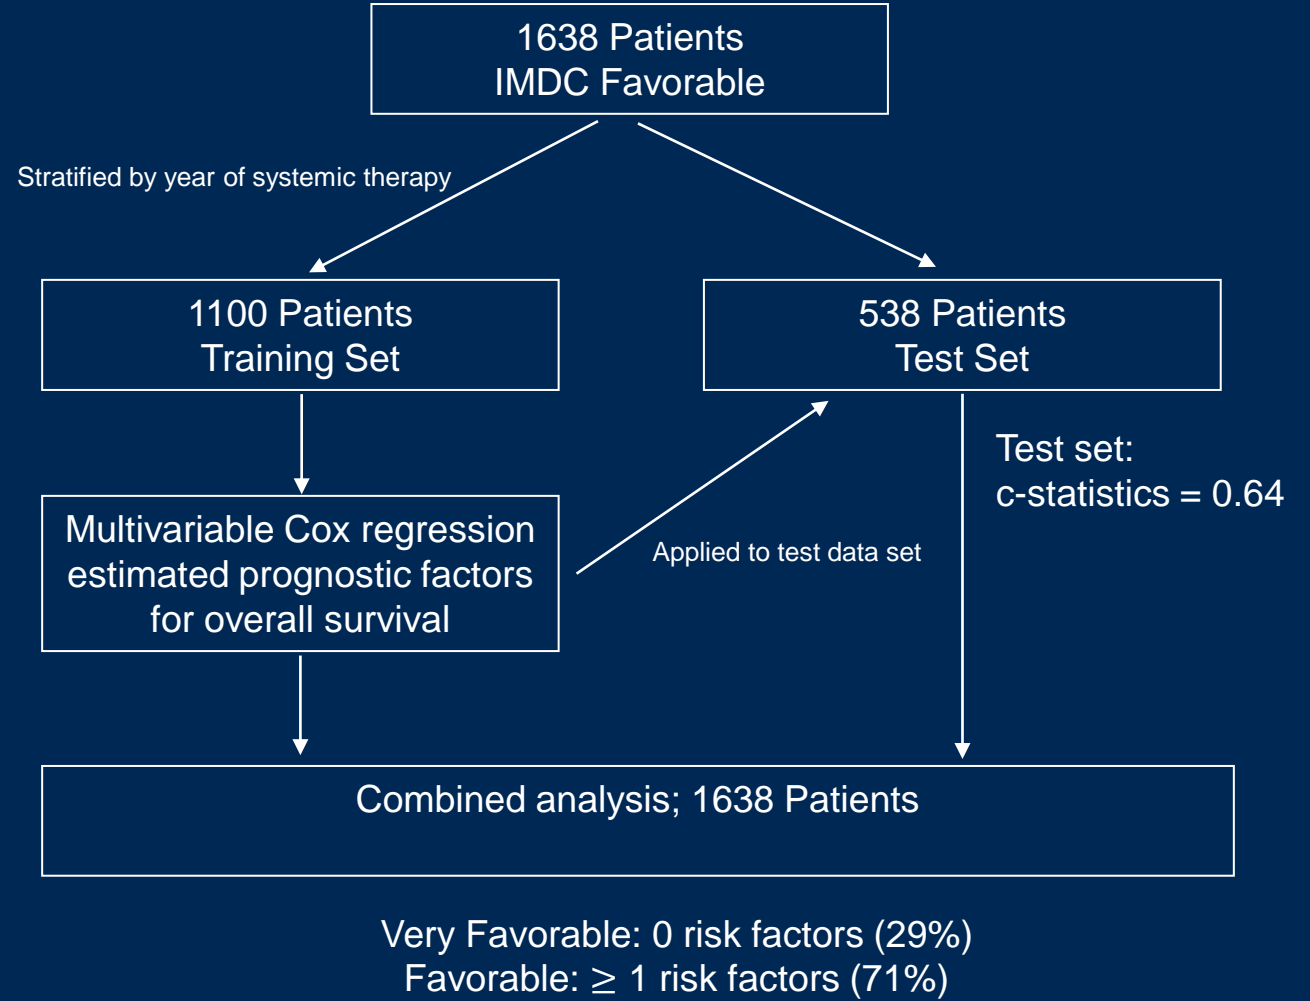

Study Design

Training set:

3 risk factors for OS

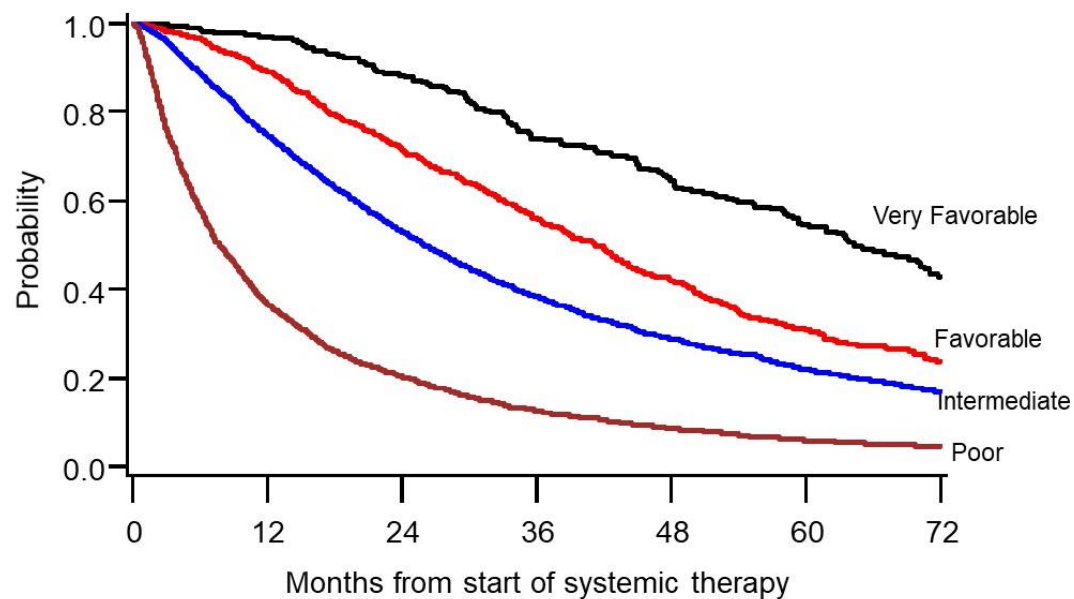

HR: 1.4~1.5; p-values<0.05

Risk Factor	1	0
Primary diagnosis to systemic therapy	< 3 yr	≥ 3 yr
Karnofsky Performance Status	80%	> 80%
Presence of brain, liver or bone metastasis	Yes	No
0 risk factors = very favorable risk ≥1 risk factor = favorable risk		

Results

Overall Survival

Very favorable	454	394	317	226	163	117	71
Favorable	1091	876	624	414	251	152	90
Intermediate	5117	3418	2096	1282	813	501	311
Poor	2482	796	373	189	108	63	41

	Very Favorable (n=454)	Favorable (n=1091)	Hazard ratio (95% CI) p-value
Median OS, months (95% CI)	64.8 (58.8 - 70.8)	45.6 (42.0 - 50.4)	1.84 (1.56 - 2.20) <0.001
Median time to treatment failure, months (95% CI)	16.3 (14.8 - 18.2)	12.0 (11.2 - 12.9)	1.31 (1.16 - 1.48) <0.001

Conclusions

Readily available clinical factors can identify a very-favorable risk cohort of mRCC patients

Results require validation in an external data set

Correlation to underlying biology is ongoing
