

Outcomes of patients with brain metastases from renal cell carcinoma treated with first-line therapies

Results from the International Metastatic Renal Cell Carcinoma Database Consortium (IMDC)

McKay, Jae-Lyun Lee, Luis Meza, Sumanta K. Pal, Frede Donskov, Takeshi Yuasa, Benoit Beuselinck, Georges Gebrael, Toni K. Choueiri, Daniel Y.C. Heng

Overview of brain metastases from renal cell carcinoma (RCC)

- Incidence of RCC brain metastases is not well known in the era of immuno-oncology (IO) combinations
- Brain metastases confer poor overall survival (OS)
- Clinical effectiveness of 1L IO-based combinations in patients with RCC brain metastases needs to be evaluated because of frequent exclusion from trials

Key clinical questions

1. Incidence of RCC brain metastases at first-line (1L) therapy initiation
2. Outcomes and prognostic factors in patients with RCC brain metastases
3. Temporal trends in brain-directed therapies for RCC brain metastases

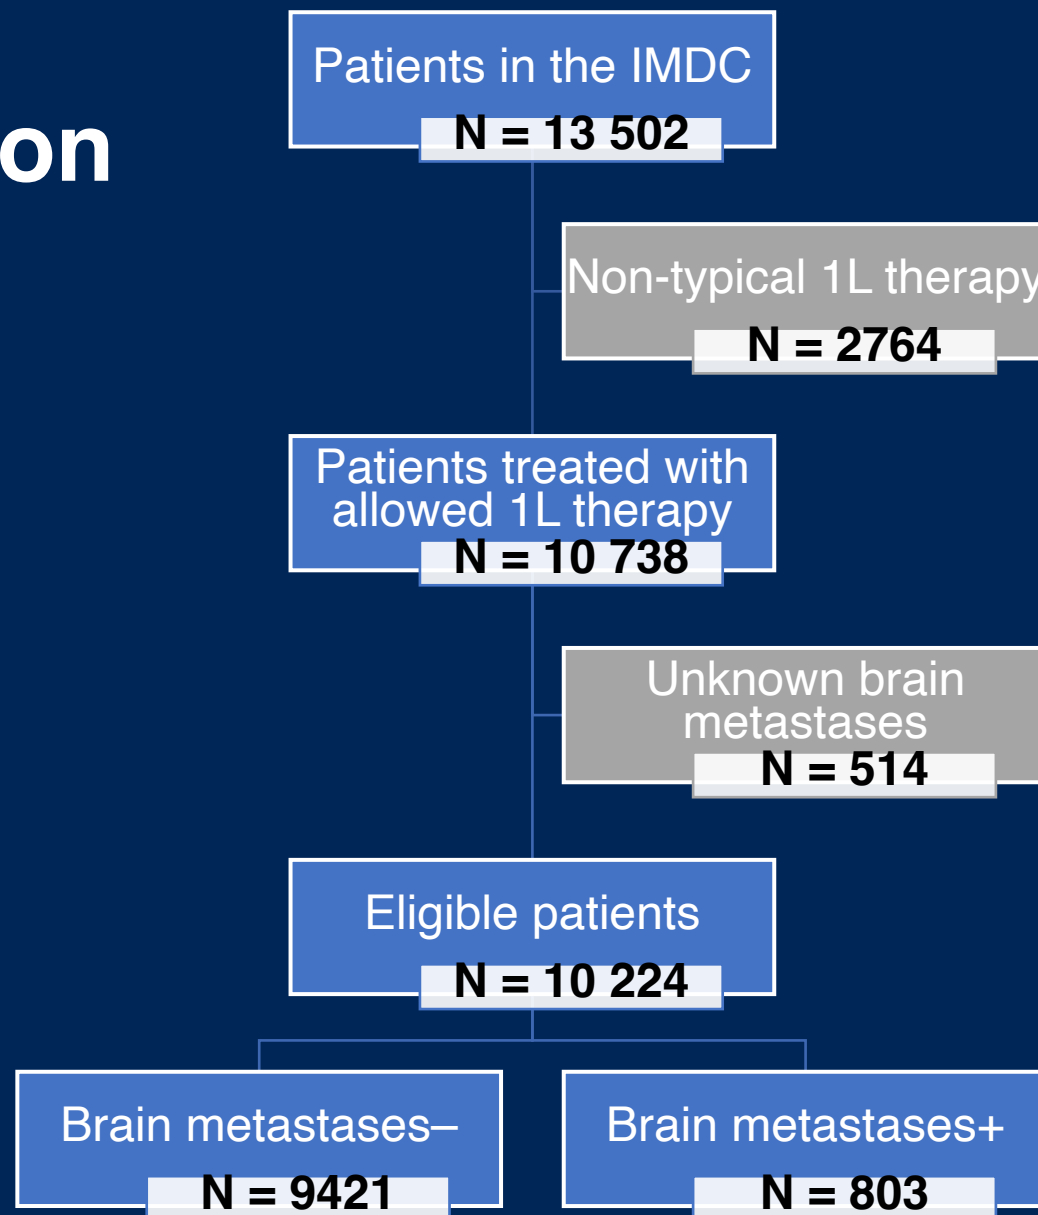

Methods

- Using the IMDC, a large, multinational cohort, patients with metastatic RCC who received any of the following 1L therapy regimens were included:
 - IO-based: NIVO/IPI, PEMB/AXI, AVEL/AXI, NIVO/CAB, PEMB/LENVA, or ATEZ/BEV
 - TKI: SUN or PAZ
- Comparison was made between contemporary IO-based combination therapy vs. traditional tyrosine kinase inhibitor (TKI) monotherapy

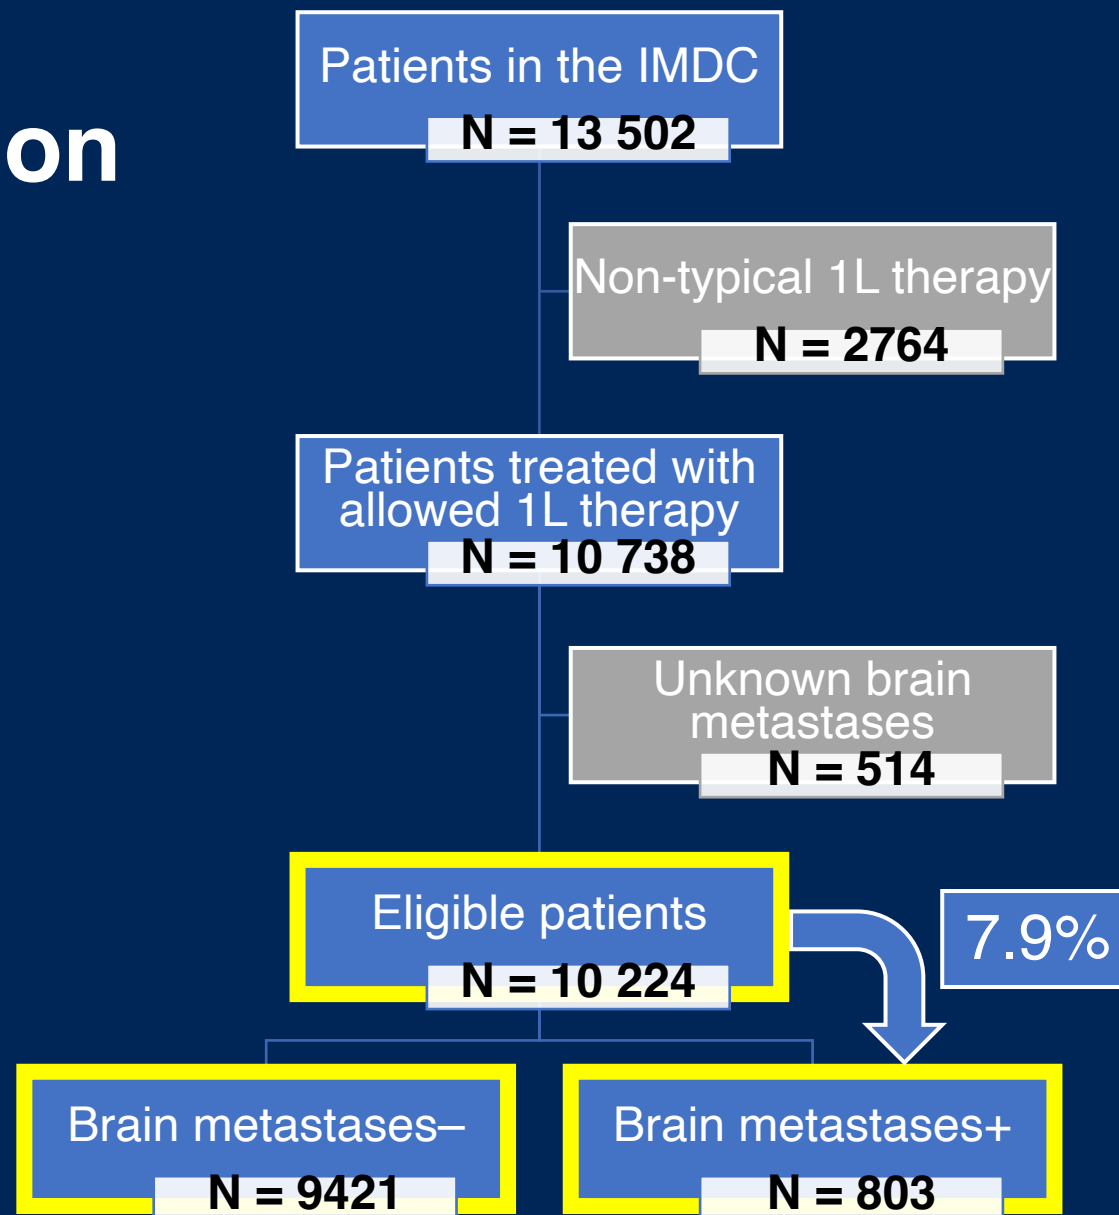

Cohort creation

Cohort creation

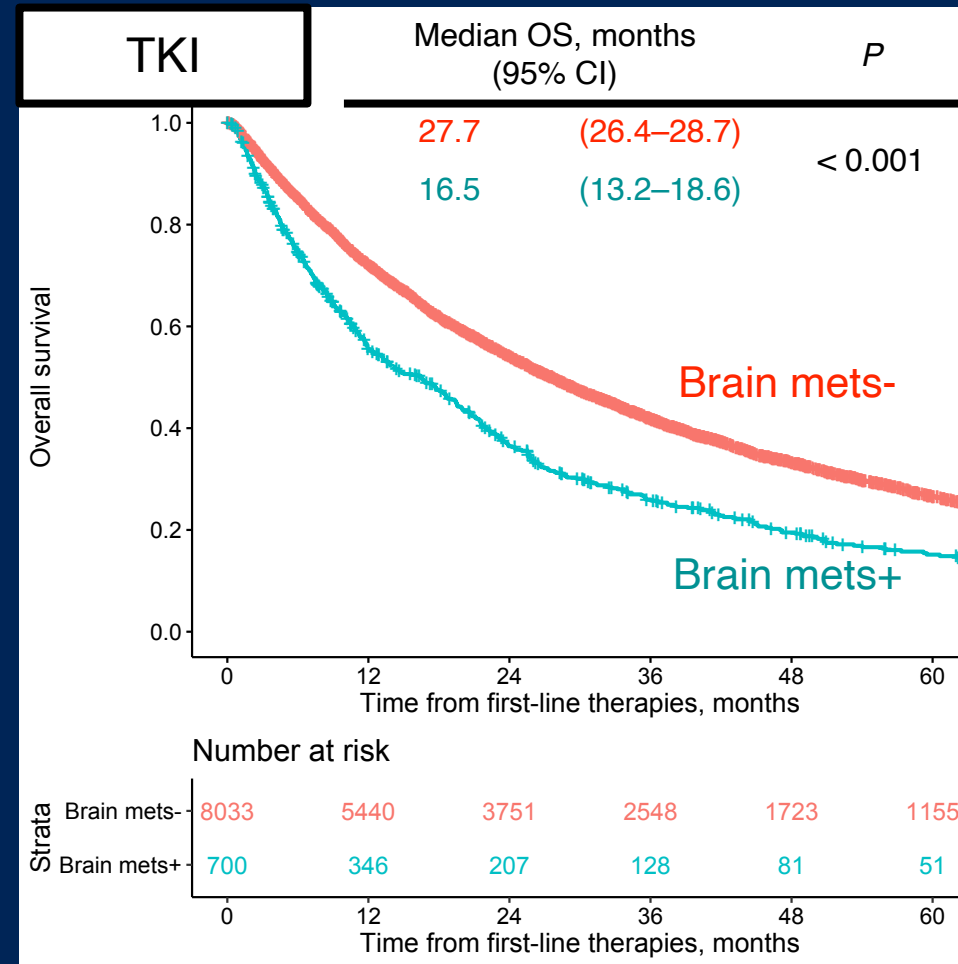

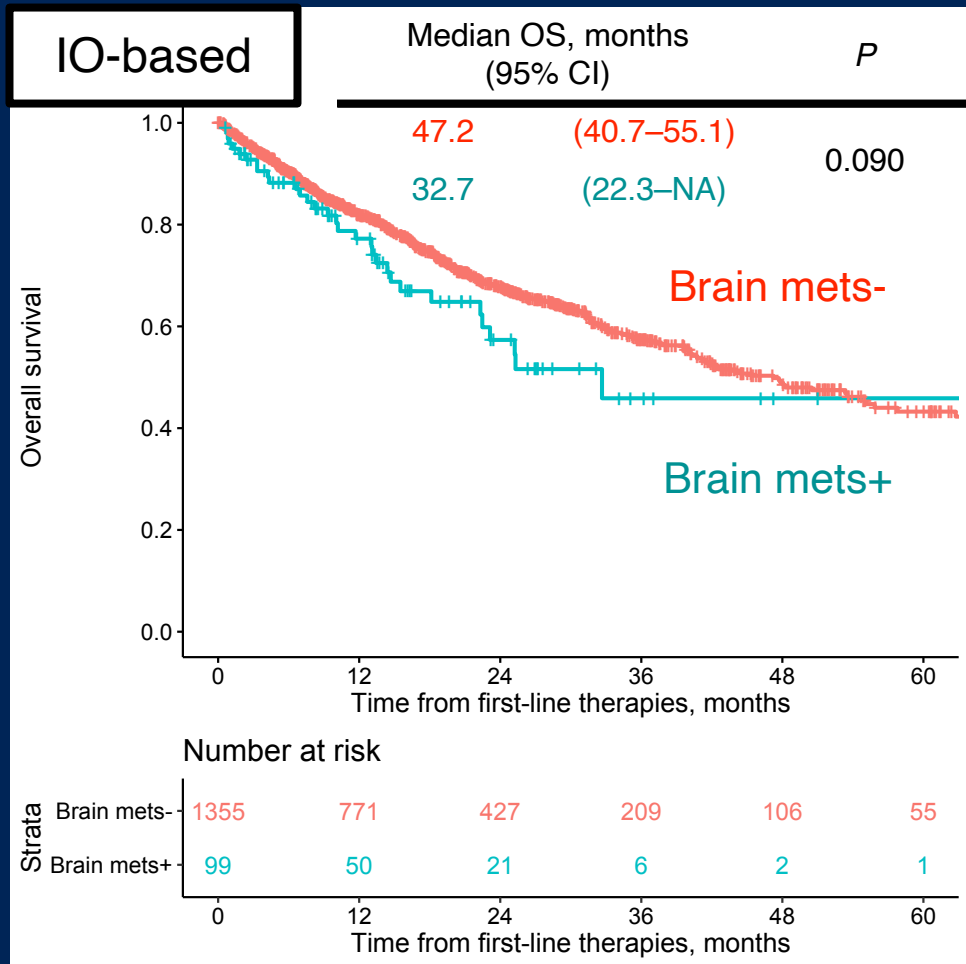

Characteristics of patients based on RCC brain metastases

Variable, N (%)	Brain metastases– (N = 9421)		Brain metastases+ (N = 803)		P
Age, median (IQR)	64	(56–72)	62	(55–69)	< 0.001
IMDC risk					0.006
Favourable	1378/7591	(18%)	93/640	(15%)	
Intermediate	4202/7591	(55%)	345/640	(54%)	
Poor	2011/7591	(26%)	202/640	(32%)	
1L regimens					0.103
IO-based	1364/9421	(14%)	99/803	(12%)	
TKI	8057/9421	(86%)	704/803	(88%)	

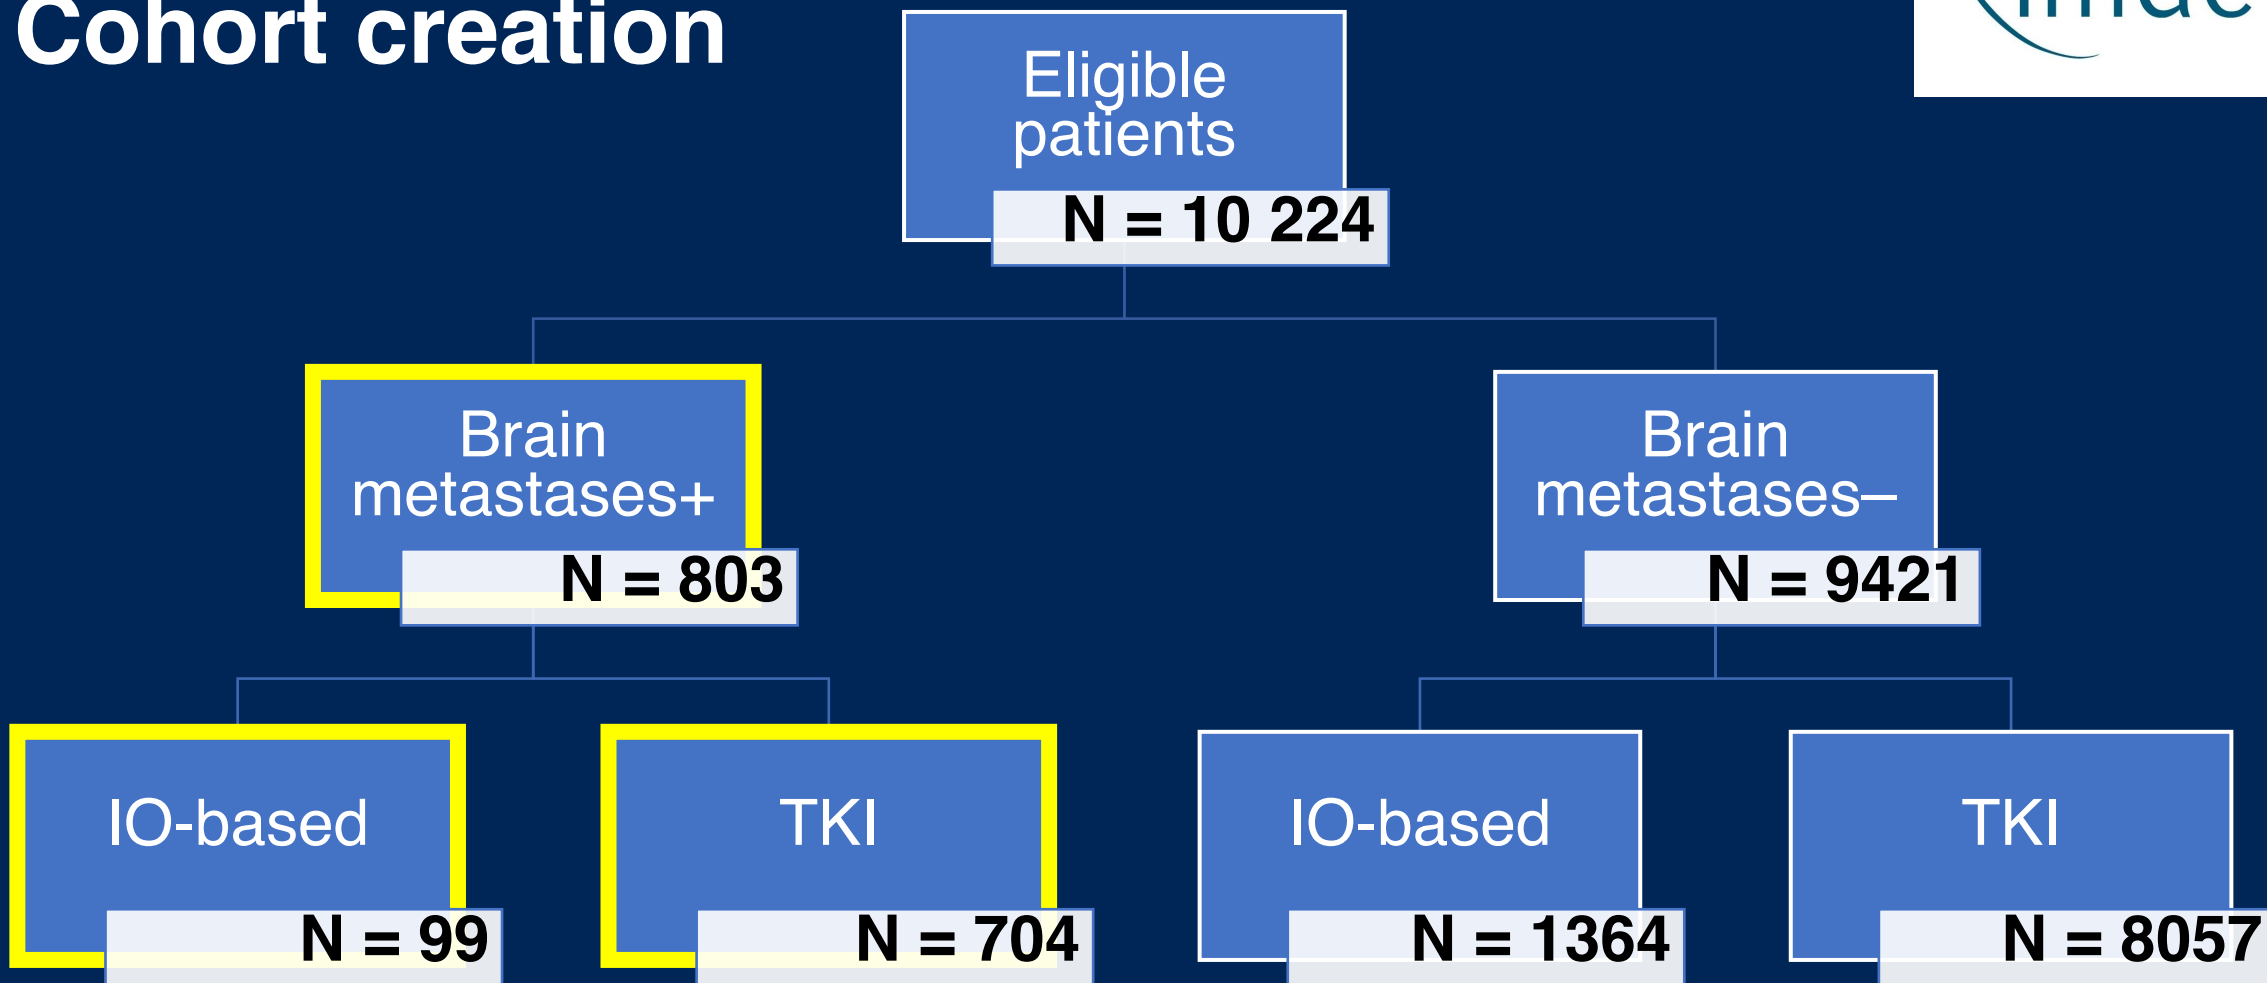

KM curves for OS in patients based on RCC brain metastases

Cohort creation

1L therapy regimens in patients with RCC brain metastases

IO-based cohort (N = 99)			TKI cohort (N = 704)		
NIVO/IPI	80/99	(81%)	SUN	534/704	(76%)
PEMB/AXI	9/99	(9%)	PAZ	170/704	(24%)
AVEL/AXI	2/99	(2%)			
NIVO/CAB	3/99	(3%)			
PEMB/LENVA	1/99	(1%)			
ATEZ/BEV	4/99	(4%)			

Characteristics of patients based on 1L therapies (IO-based vs. TKI)

Variable, N (%)	IO-based cohort (N = 99)		TKI cohort (N = 704)		P
Age, median (IQR)	63	(56–69)	62	(55–69)	0.673
Year of 1L therapy ≥ 2014	99/99	(100%)	290/704	(41%)	< 0.001
IMDC risk					0.033
Favourable	9/84	(11%)	84/556	(15%)	
Intermediate	38/84	(45%)	307/556	(55%)	
Poor	37/84	(44%)	165/556	(30%)	
Symptoms at presentation	34/60	(57%)	268/372	(72%)	0.022
Multiple brain metastases	36/67	(54%)	201/386	(52%)	0.895
Whole-brain radiotherapy	13/65	(20%)	232/476	(49%)	< 0.001
Stereotactic radiosurgery	39/65	(60%)	224/476	(47%)	0.063
Neurosurgery	24/65	(37%)	135/476	(28%)	0.191

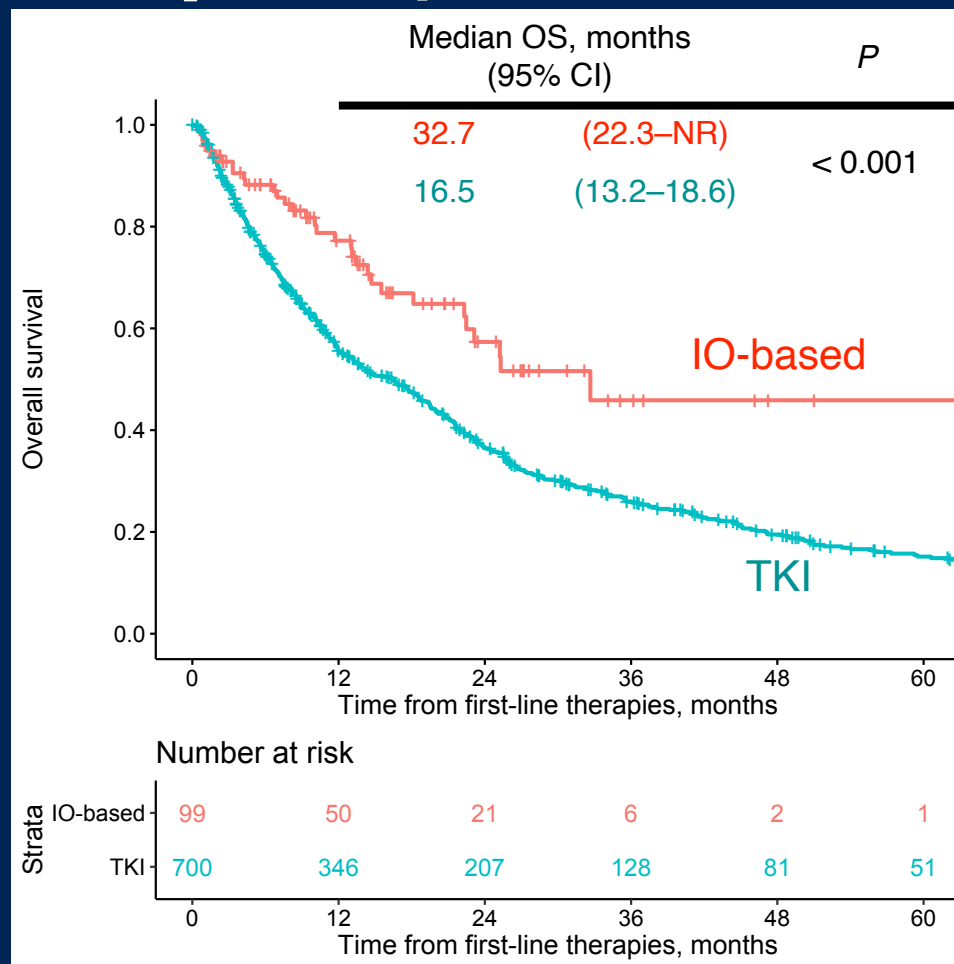

Treatment response to 1L therapies (IO-based vs. TKI)

Best overall response, N (%)	IO-based cohort		TKI cohort	
	N	%	N	%
Objective response*	31/76	(41%)	181/586	(31%)
Complete response	5/76	(7%)	4/586	(1%)
Partial response	26/76	(34%)	177/586	(30%)
Stable disease	25/76	(33%)	211/586	(36%)
Progressive disease	20/76	(26%)	194/586	(33%)

* $P = 0.090$

KM curves for OS in patients based on 1L therapies (IO-based vs. TKI)

Multivariable analysis for OS in patients with RCC brain metastases

Variable	Adjusted HR	(95% CI)	P
1L therapy (IO-based vs. TKI)	0.36	(0.21–0.61)	< 0.001
Year of 1L therapy (\geq 2014 vs. $<$ 2014)	0.92	(0.70–1.22)	0.581
IMDC risk (Fav/Int vs. Poor)	0.43	(0.33–0.56)	< 0.001
Symptoms at presentation	1.25	(0.95–1.65)	0.116
Multiple brain metastases	1.17	(0.90–1.52)	0.243
Whole-brain radiotherapy (WBRT)	1.01	(0.73–1.38)	0.971
Stereotactic radiosurgery (SRS)	0.59	(0.44–0.79)	< 0.001
Neurosurgery (NS)	0.60	(0.45–0.81)	< 0.001

Proportions of brain-directed therapies

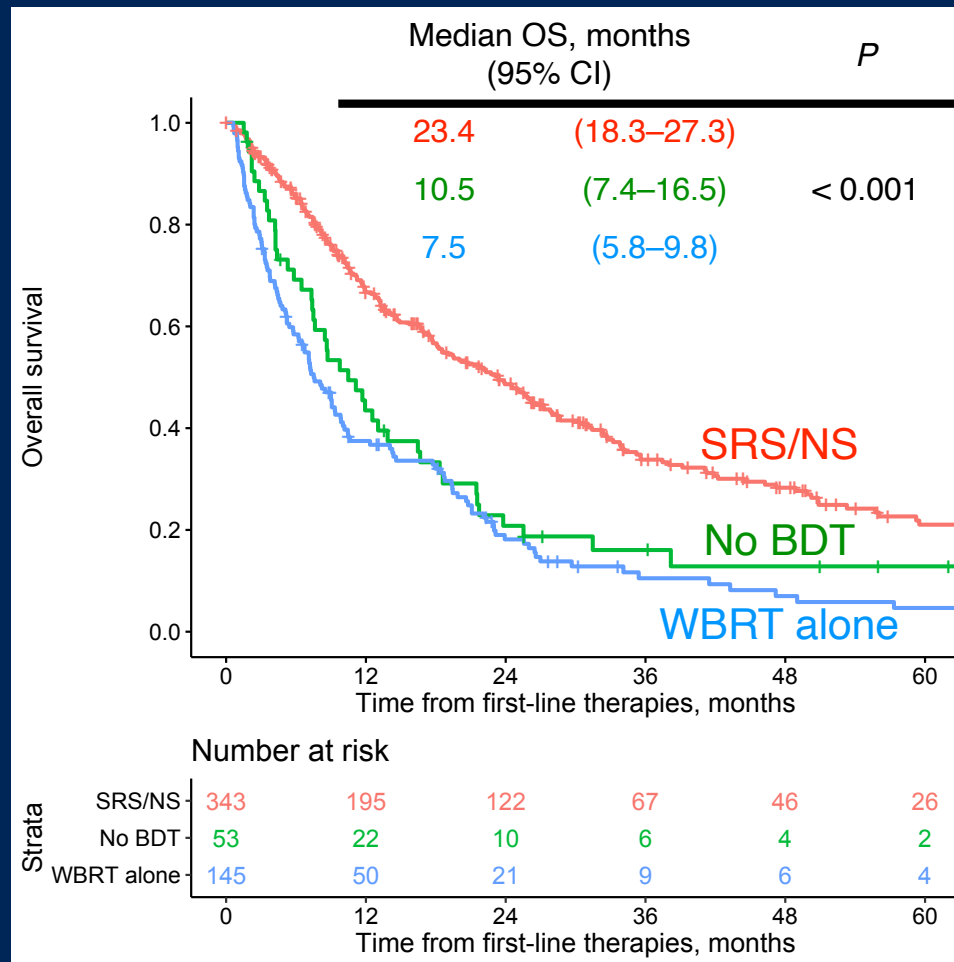

Characteristics of patients based on brain-directed therapies

Variable, N (%)	SRS/NS (N = 343)		WBRT alone (N = 145)		No BDT (N = 53)		P
Age, median (IQR)	61	(54–67)	61	(54–70)	64	(58–70)	0.125
1L IO-based therapy	48/343	(14%)	9/145	(6%)	8/53	(15%)	0.031
Year of 1L therapy ≥ 2014	198/343	(58%)	47/145	(32%)	18/53	(34%)	< 0.001
IMDC risk							0.001
Favourable	47/287	(16%)	19/127	(15%)	4/43	(9%)	
Intermediate	167/287	(58%)	62/127	(49%)	15/43	(35%)	
Poor	73/287	(25%)	46/127	(36%)	24/43	(56%)	
Symptoms at presentation	199/281	(71%)	83/110	(75%)	11/29	(38%)	< 0.001
Multiple brain metastases	133/295	(45%)	80/115	(70%)	17/30	(57%)	< 0.001

KM curves for OS in patients based on brain-directed therapies

Conclusions

- Incidence of RCC brain metastases was 7.9% at 1L therapy initiation
- IO-based therapy and intensive brain-directed therapies were independently associated with longer OS in patients with RCC brain metastases
- There were changing practice patterns in brain-directed therapies
- Treatment of RCC brain metastases requires a multidisciplinary approach
